

SPRING HANGERS

WITZENMANN

Selection

The following table indicates the possible load (required load F_s) for each VH-size depending on the hanger travel and based on the respective nominal travel s_n (50, 100 eller 200 mm). The maximum load corresponds with the nominal load F_n of the variable spring hanger. The required travel of the variable spring hanger corresponds with the vertical movement of the connected plant component due to temperature.

The load variation between cold and hot position, unavoidable in variable spring hangers, causes additional strain to the supported component. In order to limit such additional load to 25% of the operating load, the recommended working travels should not be exceeded (VGB-R 510L) which corresponds to the design criteria of the American specification MSS Standard Practices. In addition, travel reserves of at least 20% of the required travel s_s or of 5 mm as absolute minimum should be added to each limit (requirement according to VGB-R 510 and KTA 3205.3).

To save money, it makes sense to choose the load range between the hot and the cold state as close as possible to the nominal load.

Example of requirement

Variable spring hanger with double lug (standard)

Operating load: $F_w = 90$ kN

Required travel, downwards: $s_s = 25$ mm

Locking at: Cold load F_k

Selection

In case of downward required travel, the operating load occurs at higher load; it is kept as close as possible to the nominal load. Result, VH-size 11, nominal travel s_n 100 mm (from recommended working travel $\geq s_s = 25$ mm) with cold load 73.2 kN. Travel reserve: 15 mm. Load variation: $\Delta F = 16.8$ kN corresponding to 19% of F_w (read from load/travel table or calculated by means of spring rate: $\Delta F = R \cdot s_s$) Installation dimension E for preset hanger, preset distance $s_v = 60$ mm corresponding to hanger travel at cold load (from the following table).

Installation dimension: $E = E^* + s_v = 705 + 60$
 $E = 765$ mm

FHD

Variable spring hangers with double lug (including bolt) is suitable for direct connection to a hanging suspension structure – only by means of Weld-Tech or clamp lugs without additional connecting parts. The load can be set by turning the hanger turnbuckle.

FHG

Variable spring hangers with threaded connection are suitable for installation at a required level by inserting a fitting threaded rod as vertical connection to the superior steel structure. This rod is connected to the suspension structure by a clevis and a weld or clamp lug, or by use of a square plate with spherical washer, by means of hexnuts. The load can be set by turning the hanger turnbuckle.

FHS

Variable spring hangers for continuous tie rods are suitable for mounting on the suspending steel structure, to which they are fixed by bolts. The load is transferred by the through-rod and the screwed-on nuts. The load can be set by turning the nuts.

FSS/FSP

Variable spring supports with supporting plate absorb load from above. They are mounted on the steel structure by fixing the foot plate with bolts. The load is transferred to the support plate of the spring supports by a sliding or insulation shoe with flat contact surface. If lateral movements may occur, supports with PTFE slide plate (type range FSP) should be selected.

FSG

Angulating spring support absorb the load as compression force and transfer it to the suspension by spherical sway heads. Greater lateral shifting of the components to be suspended, combined with low lateral forces are thus made possible. The use of these devices is acceptable only if the inherent stiffness of the component to be suspended is sufficient to secure it in its position.

FDT

Trapeze-type hangers are suitable for the supporting of pipes near the underneath suspension steel structure. Pipes can be equipped with a suitable pipe shoe and then be placed on the trapeze. The load can be set by turning the hanger turnbuckle.

Variable Spring Hanger with double lug Type FHD

Standard version:

Hanger preset, galvanized housing and connecting parts, alkyd-painted spring.

Options:

Hanger not preset, hot-dip galvanized housing and additional terosone coating of the spring, inch thread.

Order example: FDH 11.100.42 (standard)

Variable Spring Hanger Type FSS with supporting plate made of steel Type FSP with PTFE layer

Standard version:

Hanger preset, galvanized housing and connecting parts, alkyd-painted spring.

Options:

Hanger not preset, hot-dip galvanized housing and additional terosone coating of the spring, inch thread.

Order example: FSS 11.100.42 (standard)

Connections for Angulating Spring Support (Type FSG)

For connection of these supports to pipes and steel constructions, special mounting parts, clamps and brackets are available. The design of these parts enables the supporting of dynamic load without any problems.

Bracket (with bolts) Type MBW

The brackets are designed for welding: They allow the required angularity of 6 gr.

Bracket:

Material:

Weldable - C25

Surface: Jack with primer
(standard) or without protection

Order example: MBS 025
(standard)

Selection

The other selection criteria correspond to those for single hangers FHG.

Example of requirement:

Selection

In case of upward required travel where hot load occurs at a lower value than the cold load, a hanger size should be selected which has a cold load as close as possible to the nominal load. Result: VH-size 07, nominal travel: $S_n = 100$ kN (from recommended working travel $S_s = 25$ mm). Required hot load: $F_s = F_w + F_a + F_t + F_h = 30 + 0,2 + 0,2 + 0,2^* = 30,6$ kN, Preset load: $37,3$ kN, Travel reserve: $S_r = 10$ mm. Load variation: $WF\ 25,268 = 6,7$ kN, corresponding 22% of F_w . Cold load: $F_k = 37,3 - 0,9 = 36,4$ kN

*) active load taken from tables page 3.4.1.11

Nominal travel Sn				Load												
50		100		200		01	02	03	04	05	06	07	08	09	10	11

Trapeze Hanger

Standard version:

Hanger preset, galvanized housing and connecting parts, alkyd-painted spring.

Options:

Hanger not preset, terosone coating of the spring, inch thread.

Order example: FDT 07.100.0800.20 (standard)

1) Insert span in mm. 2) Active weight of both hangers, total weight of hangers see FHG page 3.4.1.5.

*Measurements refer to initial position at minimum load (not preset); the distance changes exactly the same as the preset travel.
